

Flexible Compute Service (FCS) is Nobus Cloud's on-demand virtual server platform: launch production-grade Linux or Windows instances in minutes, resize as workloads change, and pay only for what you use - billed in local currency with zero egress fees, from Tier III-certified data centres in West and East Africa.

Instance types

Choose the shape for your workload, then the size. FCS offers four instance types:

Type	Best for
Standard	Balanced vCPU-to-memory - general web / app workloads
Compute Optimized	More vCPU per GiB - batch, media transcoding, HPC
Memory Optimized	More memory per vCPU - databases, analytics, caches
GPU Optimized	GPU-accelerated - AI / ML, rendering, scientific compute

Each type spans a wide range of sizes - 1 to 8+ vCPU and 2 to 64+ GiB, plus GPU. Example sizes include si.2.4 (2 vCPU / 4 GiB), si.4.8 (4 / 8), si.8.16 (8 / 16) and si.8.64 (8 / 64). These are examples only; larger CPU, memory and GPU configurations are available on request - confirm exact flavours in the Quote Builder.

- OS images: Ubuntu 24.04 / 22.04 LTS, Debian 12, Rocky Linux 9, AlmaLinux 9; Windows Server 2022 and 2025.
- AES-256 FBS block storage with snapshots and FOS object storage attach to any instance; resize vCPU / RAM / disk without rebuilding.

Autoscaling & load balancing

Handle traffic spikes without over-provisioning. Auto Scaling adds or removes FCS instances automatically against demand, while the managed Load Balancer spreads traffic across healthy instances for resilience and zero-downtime deploys - ideal for e-commerce peaks, campaigns and fintech transaction surges.

Dedicated Hosting

When a workload needs single-tenant isolation - for strict compliance, licensing or performance - Dedicated Hosting reserves dedicated physical servers for one customer: the control of bare metal with the operational simplicity of the Nobus platform.

- Single-tenant physical servers - no noisy neighbours.
- Ideal for regulated workloads and predictable, license-bound estates, managed from one console.

BYOL - Bring Your Own License

Already own Microsoft or Oracle licences? Bring them to Nobus on Dedicated Hosts and avoid paying twice - re-use existing entitlements (Windows Server, SQL Server, Oracle Database) on dedicated capacity while you migrate to in-region cloud.

- Re-use existing Microsoft / Oracle licences on Dedicated Hosts, or choose Nobus managed Windows licensing per instance.
- Right-license each workload for the lowest total cost.

Why FCS

- Fast - production instances in minutes, not weeks.
- In-region - Tier III zones in Lagos (Ikeja, Lekki) and Nairobi (ADC), 99.982% uptime guarantee.
- Predictable - pay-as-you-use, billed in local currency, zero egress fees.
- Secure & compliant - AES-256 encryption, security groups and next-generation cloud firewalls; ISO 27001 & PCI DSS certified, NDPA / ODPC aligned.

- Open - built on OpenStack; Terraform, OpenStack CLI and REST APIs work as your engineers expect.
