

Security attaches to every infrastructure deal - and it protects your margin. Nobus instances ship with security groups and a cloud-native firewall as the baseline; this card is how you layer perimeter, visibility and recovery on top with Sophos, Fortinet and Acronis. Rule of thumb: no FCS deal should leave without a firewall and a backup, and every regulated customer needs SIEM.

The stack at a glance

Product	What it is	Lead with it when
Sophos XG Firewall	Next-gen firewall - IPS, web & app control, VPN and sandboxing in one appliance	SMB to mid-market perimeter; teams that want strong protection that is simple to run
FortiGate NGFW	Fortinet next-gen firewall - high throughput, deep inspection, SD-WAN	Larger or regulated estates, high-throughput sites, Fortinet-standardized shops
FortiSIEM	Security information & event management - log correlation, threat detection, compliance reporting	Compliance mandates (PCI DSS, ISO 27001), central visibility, a customer building a SOC
Acronis Cyber Protect (Nobus Cloud Backup)	Backup + anti-ransomware + vulnerability scanning from one console; multi-cloud, including M365 and Google Workspace	Data protection, ransomware defence and DR; backing up M365, OneDrive/SharePoint, Google Workspace or other clouds

How the layers fit together

Perimeter -> inspection -> visibility -> recovery. Sophos XG or FortiGate guards the edge and segments traffic; FortiSIEM correlates events across the whole estate so nothing hides; Acronis Cyber Protect (Nobus Cloud Backup) is the safety net that gets the customer back online after ransomware or failure. Each layer is a separate line on the quote and a separate reason the customer stays.

Talk tracks

- Firewall (Sophos XG / FortiGate): "A security group filters ports; a next-generation firewall inspects what is inside the traffic - intrusions, malware, risky apps. On a regulated workload that is the difference between a checkbox and real protection."
- FortiSIEM: "Your auditors will ask who did what, and when. FortiSIEM is the single pane that answers it - correlated logs, real-time alerts and the compliance reports already formatted for PCI DSS and ISO 27001."
- Acronis / Nobus Cloud Backup: "Backup is not just the servers. We protect M365 - Exchange, OneDrive, SharePoint - Google Workspace, and workloads on AWS or Azure too, with anti-ransomware built in. One console, one throat to choke."

Compliance & cross-sell

- PCI DSS is a must for financial-services customers - firewall + SIEM + protected backup is the baseline they cannot pass an audit without.
- ISO 27001 and NDPA alignment: in-country hosting plus this stack is a complete, defensible story.
- Attach discipline: every FCS deal gets a firewall + backup; every regulated deal adds FortiSIEM. Bigger deal, stickier customer.

Discovery questions

- What is your current perimeter - and when was its firmware last updated?
- If ransomware hit tonight, what is your recovery time - and is M365 / Google Workspace in that plan?
- Which compliance regime are you audited against, and who assembles the evidence today?

Build the secured quote

Add Sophos XG, FortiGate, FortiSIEM and Nobus Cloud Backup as line items in the PartnerCentral Quote Builder.
