

Use this when a prospect is on - or defaulting to - a foreign hyperscaler. Do not attack AWS or Azure on engineering; you win on the economics and the reality of running Nigerian workloads. You budget and pay in Naira, you never pay to get your own data out, your data stays in-country under the NDPA, and support is local. Lead with those four.

Head to head

Dimension

Billing currency	US dollars - your bill moves with the FX rate	Naira - the price you agree is the price you pay
Egress / data-out	Charged per GB; grows as you serve more traffic	Zero egress fees - serving data costs nothing extra
Data residency	Nearest region is often outside Nigeria (eu-west, South Africa)	In-country, Tier III Lagos & Nairobi - NDPA-aligned by design
Support	Global tiers, premium paid, largely offshore hours	Local team on WAT, direct partner escalation, a human on the line
Latency to NG users	100 ms+ to Europe / US regions	Single-digit millisecond, in-region
Pricing model	Complex, thousands of SKUs, hard to forecast	Transparent Naira unit pricing, pay-as-you-use

The four messages that win

- Budget in Naira, pay in Naira. A dollar bill can swing 20-30% on FX alone; Nobus removes that risk entirely - the quote is the invoice.
- Zero egress fees. Hyperscalers meter every GB leaving their cloud, so media, backups and APIs make the bill balloon. On Nobus, data-out is free.
- Your data stays in Nigeria. Tier III in-country hosting makes NDPA data-residency straightforward instead of a cross-border legal negotiation.
- Local support that answers. In-region engineers on your timezone, reachable through your Nobus partner - not a ticket queue eight hours away.

Objection handling

- "AWS has more services / is more mature." True - and most enterprises use a fraction of them. For the core estate (compute, storage, Kubernetes, Kafka, four database engines, firewalls, DNS) Nobus is complete; name the workaround for anything niche, never bluff.
- "Is a local cloud as reliable?" Nobus runs on OpenStack in Tier III certified facilities with a 99.982% uptime guarantee, redundant power, cooling and network - the standard banks and telcos already trust.
- "We are standardized on AWS tooling." Terraform, REST APIs and the OpenStack CLI work as your engineers expect - migration is a re-point, not a re-skill.

Be honest - and use it to build trust

- If an architecture truly needs a niche managed service Nobus lacks, say so. Candour wins the next deal.
- It is not either/or: Nobus Cloud Backup even protects workloads that stay on AWS or Azure, so hybrid is a first step, not a betrayal.

Turn positioning into a number

Build a side-by-side Naira quote in the PartnerCentral Quote Builder, or model the savings in the Nobus Pricing Calculator.
